AB The title compds. [I; Z = O, S; R1 = alkyl, alkenyl, alkoxy, etc.; R2-R6 = alkyl, alkenyl, alkoxy, etc.; adjacent pair of R2-R6 together with the carbon atoms to which they are attached form (un)substituted carbocyclyl, **heterocyclyl**; R7 = alkyl, alkenyl, alkoxy, etc.; n = 0-3] and their pharmaceutically acceptable salts which are non-peptide antagonists of human orexin receptors, in particular orexin-1 receptors, were prepared E.g., treatment of 4-amino-2-methylquinoline with carbonyl diimidazole in CH2Cl2 followed by addition of 6-amino-2-methylbenzoxazole afforded II which showed pKb > 6.0 against orexin-1 receptor. In particular, compds. I are of potential use in the treatment of obesity including obesity observed in Type 2(non-insulin-dependent) diabetes patients and/or sleep disorders.

AB α,β-Unsatd. ketone derivs. represented by general formula RCH:CHCOR1 [R = Q, Q1; wherein Z = NH, O, S; ring B = an optionally substituted aromatic ring; R2 = H, halo, optionally halogenated lower alkyl, etc.; R3 = H, optionally halogenated lower alkyl, cycloalkyl optionally having heteroatom(s), alkoxyalkyl, optionally substituted aryl, optionally substituted heteroaryl, etc.; R1 = CR4R5R6; wherein R4, R5 = H, optionally halogenated lower alkyl, etc.; R6 = H, optionally halogenated lower alkyl, cycloalkyl optionally having heteroatom(s), optionally substituted aryl, optionally substituted heteroaryl, etc.] or pharmacol. acceptable salts thereof, which are useful for the prevention and treatment of interleukin 1 production-related diseases, e.g. inflammation, are prepared Thus, 1.68 g 7-ethyl-4-methoxymethoxy-3,5,8-trimethoxy-2-quinolinecarboxaldehyde and 1.0 g 3-hydroxy-3-methyl-2-butanone were dissolved in MeOH, treated with 0.21 g LiOH.H2O and heated at 50-60° for 1 h to give, after treatment of the product with 1 N aqueous HCl in EtOAc, the title quinolinylbutenone derivative (I; R7 = R10 = OMe, R8 = H, R9 = Et, R11 =

CMe2OH). The latter compound and I (R7 = R9 = R10 = H, R8 = Cl, R2 = R11 = Me) showed IC50 of 1.08 and <0.1 nM, resp., for inhibiting the production of interleukin 1α in human peripheral monocyte and 0.92 and <0.1 nM, resp., for inhibiting the production of interleukin 1β in human peripheral monocyte.

AB cf. C. A. 37, 1714.8. The successful use of 4,6-diaminoisophthalaldehyde for the previous synthesis of 1,8-anthrazoline derivs. (C. A. 32, 562.7) suggested the use of the corresponding 2,5-diaminoterephthalaldehyde (I) as a starting material for the preparation of derivs. of a new linear benzodipicoline, 2,7-dimethylpyrido[2,3-g]quinoline (II). Attempts to prepare I through 2,5-dichloroterephthalaldehyde (III) from 2,5-dichloro-p-xylene (IV) are briefly described though the yields and purity of the products left so much to be desired that a more successful approach was made through the corresponding 2,5-dibromoterephthalaldehyde (V). The chlorination of 50 g. p-xylene in the presence of 5 g. Fe powder in the dark at 12-15° in 3 hrs. and crystallization of the product from MeOH gave 43 g. (50%) of IV, m. 70-1°. Chlorination of the side-chain by passing dry Cl into 20 g. IV in 12 g. C6H2Cl4 at 120-30° with illumination gave 16.8 g. of 1,4-bis(dichloromethyl)-2,5-dichlorobenzene (VI), m. 72.5-4.0°, saponified by heating at 150-70° with concentrated H2SO4 for 20 min. The crude product, m. 144°, was purified through the dianil, C20H14Cl2N2, m. 213-140°, saponified by refluxing with 10% HCl and recrystd. from PhNO2 to give yellow needles of III, m. 157-8°. Other chlorination products including 2,3,5,6-tetrachloro-p-xylene, m. 216.5-17.0°; 1,4-bis (chloromethyl)-2,3,5,6-tetrachlorobenzene, m. 174.5-5.0° (dianil, C20H16Cl4N2, m. 170°); 1,4-bis(trichloromethyl)-2,5-dichlorobenzene, m. 193°. Bromination of 25 g. IV at 180 with 92 g. Br for 3.5 hrs. and crystallization of the product from CHCl3 yielded 40 g. of 1,4-bis(dibromomethyl)-2,5-dichlorobenzene, m. 127.5-8.0°. The bromination of 20 g. of p-xylene at 10-15° in the presence of a trace of iodine with 21.1 cc. Br and recrystn. of the crude product from alc. gave 44 g. of 2,5-dibromo-p-xylene (VII), m. 73.5-4.0°. Bromination of the side chain by adding in 5 hrs. 42.5 cc. Br to 50 g. VII at 120° and recrystn. of the crude product from 1100 cc. of boiling AcOEt yielded 78-81 g. (71-4%) of light yellow needles of α,α,α',α',2,5-hexabromo-p-xylene (VIII), m. 160-2. A mixture of 50 g. VIII and 250 cc. of H2SO4.H2O was heated at 130-40° and 25 mm. for 1 hr. The cooled solution was diluted with 1 kg. of ice and the crude product (26 g., m. 180-5°) was recrystd. from 250 cc. AcOH, producing 21.1 g. (84%) of V, m. 189-190.5°; dianil, m. 234.5-5.0°; tetraacetamide, m. above 305°. A mixture of 10 g. V with 1 g. Cu powder, 1 g. CuBr, 1 g. K2CO3, 18 g. of p-MeC6H4SO2NH2 and 40 cc. PhNO2 was heated at 140° and treated with 14 g. K2CO3 in 2 hrs. at 150-5°. After 3 hrs. at 160° the reaction mass was worked up and the crude product was recrystd. from AcOH and PhNO2, yielding 52-4% of 2,5-di-p-tolylsulfonamidoterephthalaldehyde (IX), C22H20N2O6S2, m. 241-3° (decomposition); dianil, m. 297° (decomposition). Condensation of 5 g. IX with 25 cc. AcCH2CO2Et at 70 in the presence of 12 drops of piperidine and crystallization from alc. gave 90% of di-Et 2,5-bis(p-tolylsulfonamido)terephthalylidenediacetoacetate (X), C34H36N2O10S2, m. 216-17° (decomposition). Treatment of 1.5 g. X with 5 cc. concentrated H2SO4 at 27-32° (not over 40) gave a one-sided ring-closure with the formation of Et 2-methyl-3-carbeth oxy-6-amino-7-quinoline(methyleneacetoacetate) (XI), m. 219-20°; picrate, m. 215-20° (decomposition). Treatment of 5 g. X with 20 cc. H2SO4 for 1 hr. below 95° saponified the ester group and gave 1.9 g.

of 2-methyl-3-carboxy-6-amino-7-quinoline(methyleneacetoacetic acid) (XII) which on further treatment with concentrated H2SO4 at 98-100° underwent further ring closure to 2,7-dimethylpyrido[2,3-g]quinoline-3,8-dicarboxylic acid (XIII), m. 320° (decomposition), also similarly prepared from X and XI. Decarboxylation of 1 g. XIII by adding it portionwise in 5 min. to 12 cc. quinoline at 215° containing 0.2 g. Cu powder and 0.2 g. CuCrO2, followed by removal of the quinoline with steam distillation and recrystn. of the crude product from alc., gave 0.2 g. (30%) of needles of II, C14H12N2, m. 238-9° (decomposition); picrate, m. 263° (decomposition); dibenzylidene derivative, m. 267°; bis(p-dimethylaminobenzylidene) derivative, m. above 340°. Treatment of 0.5 g. IX with 5 cc. PhCOMe at 190-7° for 1.5 hrs. and recrystn. of the product from alc. and PhNO2 produced greenish yellow leaflets of 2,7-diphenylpyrido[2,3-g]quinoline, m. 284-5°. From 100 g. p-xylene, the main products were 123 g. aldehyde (V), 100 g. sulfonamide (IX), 105 g. condensation product (X), 25 g. dicarboxylic acid (XIII) and, finally, 5 g. II.

AB The 3,6-dicarboxylic ester produced by the addition of 2 mols. AcCH2CO2Et to 4,6-diaminoisophthalaldehyde (I) was saponified to the free acid which was decarboxylated by heating with Cu in quinoline at 160-230° for 20 min. The resulting 2,7-dimethylbenzodipyridine (II) was converted into the hexa-Br derivative which was transformed by heating with oleum to the crude benzodipyridine-2,7-dicarboxylic acid (III). A mixture of 0.25 g. III, 2 cc. of 10% NH4OH and 2 cc. alc. was triturated, diluted with 20 cc. H2O and heated. The NH3-free product was diluted with 10 cc. H2O and boiled

with 0.5 g. $AgNO_3$ in 10 cc. H_2O. The crude Ag salt (0.45 g.) was boiled with 70 cc. MeOH and 0.4 g. MeI for 1 h., filtered and concentrated to 20 cc., yielding 0.2 g. (70%) of yellow needles of di-Me benzodipyridine-2,7-dicarboxylate, $C_{16}H_{12}N_2O_4$, m. 272° (with darkening). Decarboxylation of III gave benzodipyridine (IV); perchlorate, m. 268° (explosive on rapid heating); MeI derivative, m. above 200° (decomposition). Reduction of 0.2 g. IV in 5 cc. of boiling AmOH with 0.35 g. Na and recrystn. from alc. gave octahydrobenzodipyridine, m. 111.5°, identified through the di-NO and di-Ac derivs., m. 179° (decomposition) and 143°, resp. Reduction of II with Na in AmOH gave as main product a resin which was converted into a colorless crystalline octahydro-2,7-dimethylbenzodipyridine diperchlorate, $C_{14}H_{22}Cl_2N_2O_8$, m. 285-6° (decomposition). The resinous free base yielded 2 isomeric di-NO derivs., m. 164.5 and 151.5-2.0°, resp. Condensation of 0.2 g. II with 0.5 g. of p-$Me_2NC_6H_4CHO$ at 170-5° in the presence of 10 drops of piperidine produced 0.45 g. of orange-red 2,7-bis(p-dimethylaminostyryl)benzodipyridine, $C_{32}H_{30}N_4$, m. about 340° (with darkening), dissolving in HCl to give violet, blue, green and yellow solns. with increasing acid concns. Condensation of II with o-$C_6H_4(CO_2Et)_2$ by heating in the presence of Na for 14 h. at 100° gave a scarlet crystalline powder which on sulfonation dyed wool and silk bluish red in an acid bath. A unilateral condensation of 0.6 g. I with 6 cc. $AcCH_2CO_2Et$ occurred on heating in the presence of 9 drops of piperidine for 30 min. at 170°. The impure 3-acetyl-6-formyl-7-aminocarbostyril yielded yellow crystals of a pure Ac derivative, $C_{14}H_{12}N_2O_4$, m. 320-40° (decomposition). Treatment of 1 g. I in 100 cc. alc. at 30° with 14 g. of dry $OHCCHNaCO_2Et$, boiling for 1 h. after standing for 3 days, filtering off the brown amorphous precipitate (V), adding 1 cc. H_2O and standing for 8 days gave a Na salt which was dissolved in 50 cc. H_2O, acidified with 10% HCl and recrystd. from dioxane, yielding di-Et 2,6-diaminoisophthalaldiformylacetate, $C_{18}H_{20}N_2O_6$, m. 250° (decomposition). V was dissolved in H_2O, filtered and precipitated with dilute HCl.

The amorphous product (0.06 g.) was decarboxylated by heating in vacuo with 0.3 g. BaO and 0.5 g. Cu at 150° to yield a bright yellow sublimate of IV. Condensation of I with excess cyclohexanone in the presence of piperidine produced 2,3,6,7-bis (tetramethylene)-benzodipyridine, $C_{20}H_{20}N_2$, m. 250-1° (with darkening); dipicrate, m. 195° (decomposition). A mixture of 8 g. I in 150 cc. alc., 24 cc. $PhCH_2CN$ and 12.5 cc. of 30% NaOH was heated for 30 min. on the steam bath. Working up and purification through the di-HCl salt gave a free base (VI), $C_{24}H_{18}N_4$, m. 301°; tetra-Ac derivative, $C_{32}H_{26}N_4O_4$, m. 238.5-9.5° (decomposition). Saponification of VI with HCl produced a carboxyl derivative, $C_{24}H_{18}N_2O_3$, which gave a Na salt and a mono-Ac derivative, m. 365°. Condensation of 4 g. of 4,6-dinitroisophthalaldehyde with 8.4 g. of dry $PhCH(Na)CO_2H$ by heating with 34 cc. Ac_2O and 1.2 g. $ZnCl_2$ for 40 h. at 80° gave a powdery dicarboxylic acid which was esterified through the Ag salt to di-Me 4,6-dinitroisophthalalbis(phenylacetate), $C_{26}H_{20}N_2O_8$, m. 152.5-3.5°. Condensation of methazonic acid (VII) with o-$H_2NC_6H_4CHO$ yields 3-nitroquinoline and similarly a cold mixture of VII and I in the presence of a min. of HCl gave 20% of yellow-orange needles of a compound $C_{16}H_{14}N_6O_5$, m. 290° (decomposition), of undetd. composition

AB cf. C. A. 32, 3394.4. Dinitroisophthalaldehyde (I) (7 g.) in 40 cc. pyridine was warmed to 60°. CO2 and nitrous fumes developed, the temperature rose to 100° and the reaction ended in 45 min. Recrystn. of the resulting 4.8 g. of brown powder gave yellow leaflets, C25H18N2O6, m. above 300°. Other reactions of I with barbituric acid, indandione and methylphenylpyrazolone are cited. The product (0.5 g.) of the reaction between 7 g. I and CH2N2 (C. A. 31, 4287.9) is now considered to be 4,6-dinitrophenylene-1,3-diethylene oxide; C10H8N2O6, m. 153-4°, converted by HCl in pyridine to the corresponding 4,6-dinitrophenylene-1,3-diethylene chlorohydrin, C10H10Cl2N2O6, m. 150-1°. Boiling 2 g. Et diaminophenylenediacrylate (C. A. 31, 4287.9) with 30 cc. concentrated HCl for 15 min. gave 1.2-1.4 g. of impure 4,6-diaminophenylene-1,3-diacrylic acid HCl salts (II), converted by heating with a 20-fold excess of Ac2O at 120° to the mono-Ac derivative, C14H14N2O5, m. 320° (decomposition). Refluxing with 80 parts Ac2O for 50 min. produced the di-Ac compound, C16H16N2O6, m. 320° (decomposition). The mother liquors of the above saponification yielded yellow matted needles of 7-aminocarbostyril-6-acrylic acid, C12H10N2O3, m. above 300°. Heating 0.5 g. II with 25 cc. concentrated HCl in a bomb-tube for 5 h. at 160° gave, by double ring-closure, 2,7-dihydroxybenzodipyridine, C12H8N2O2, charring above 400°. Most condensations run more smoothly with diaminoisophthalaldehyde (III) than with I, on account of the sensitivity of the latter to alkaline condensation agents. Thus, refluxing 0.65 g. III in 50 cc. alc. and 1 g. barbituric acid in 30 cc. H2O for 10 min. produced 1.4 g. of fine, crystalline orange powder, 4,6-diaminoisophthalaldibarbituric acid, C16H12N6O6, charring above 300°. It is remarkable that no further ring-closure between the adjacent CO and NH2 groups takes place as in the condensation of o-H2NC6H4CHO with barbituric acid. In the presence of 10 drops of KOH in MeOH 0.5 g. III condensed with 5 g. of p-MeOC6H4Ac at 150° to give 0.6 g. of 2,7-di(p-methoxyphenyl)benzodipyridine, C26H20N2O2, m. 268-9°. Condensation of III (2.5 g.) with 10 g. AcCH2Ac in the presence of 15 drops of piperidine in a bomb-tube at 180-90° for 1.5 h. gave 3.5 g. of 2,7-dimethyl-3,6-diacetylbenzodipyridine dihydrate, C18H16N2O2.2H2O, m. 213-15°, converted by heating with Ac2O for 1 h. into an addition compound, C18H16N2O2.Ac2O which, on warming, gave the free base; dioxime, C18H18N4O2, m. 255-7°. III condensed with BzCH2CO2Et by 1-sided ring condensation to 3-benzoyl-6-aldehydo-7-aminocarbostyril, C17H12N2O3, m. 278-9° (decomposition); Ac derivative, C19H14N2O4, m. about 320° (decomposition). The ester resulting from the

condensation of III with AcCH2CO2Et in the presence of alc. NaOH (C. A. 31, 4287.9) was saponified and decarboxylated by heating 10 g. of the ester with 75 cc. concentrated HCl in a Durobax bomb-tube (70 cm. by 2.2 cm.; capacity, 270 cc.) up to 130° in 1.0-1.5 h. and for 2 h. at 130°. The crude product gave a high-melting polymer, C14H12N2.2H2O, m. 268°, and 2.8 g. of benzodi-α-picoline (IV), C14H12N2, m. 196-7°; dipicrate, m. 220° (decomposition); monoperchlorate, m. 228-30° (decomposition); diperchlorate, m. 318° (decomposition); chromate; MeI compound, sintering at 244°; dibenzal derivative, C28H20N2, m. 279°; difural derivative, C24H16N2O2, m. 271.5-2.5° (decomposition). Bromination of 4 g. IV in 80 cc. AcOH and 20 g. anhydrous AcONa at 70° with 18.5 g. Br in 40 cc. AcOH with stirring gave 12 g. (90%) of the hexa-Br derivative (V), C14H6Br6N2, m. 190-2° (decomposition), converted by heating with 15% oleum for 50 min. into the corresponding dicarboxylic acid (VI). A mixture of 0.6 g. VI, 2.5 g. Naturkupfer C, 1.8 g. anhydrous Ba(OH)2 and 1.8 g. BaO was sublimed in vacuo at 230-40° and yielded 45% (1.8 g.) of a yellow crystalline sublimate, m. 159-63°. The crude was dissolved in 15 cc. CHCl3 (distilled over K2CO3), filtered and shaken out with 2 cc. of 10% NaOH and with 4 lots of H2O (3 cc.). After drying over MgSO4, treating with charcoal and evaporating, the residue (0.11 g.) was recrystd. from 8 cc. H2O to give snow-white needles of lin-benzodipyridine (1,8-diazaanthracene) , C12H8N2, m. 164.5-5.0°; dipicrate, m. 262° (darkening).

AB 4,6-Dinitro-1,3-xylene (100 g.) and 150 g. p-NOC6H4NMe2 were boiled 8 h. in 500 cc. EtOH containing 100 g. anhydrous Na2CO3. Extraction of the crude product with 1.5 l. H2O and then 3 times with 350 cc. Me2CO left 57% of condensation product (I), 100 g. of which was shaken 24 h. with 620 cc. C6H6 (II) and 620 cc. HNO3 (d. 1.12). After filtering off the p-NH2C6H4NMe2.HNO3, the II layer was separated, and concentrated to 100 cc., when 4,6-dinitroisophthalaldehyde (III) (dianil, m. 164.5-65°; disemicarbazone, m. above 360° (decomposition)) crystallized III condenses with compds. containing an active CH2 group. Thus 1.5 g. III in 10 cc. pyridine (IV) was added to 3 g. barbituric acid in 90 cc. hot H2O. After long standing addition of dilute H2SO4 precipitated 4,6-dinitroisophthalaldibarbituric acid. CH2N2 (from 23 g. NO(Me)NCO2Et) in 200 cc. ether was poured over 7 g. III and left 15 h. in the ice box. Long fractional crystallization of the precipitate from EtOH gave 4,6-dinitro-1,3-diacetylbenzene, m. 153-4°. III (20 g.), 100 g. (HO2C)2CH2 and 60 cc. IV were warmed 48 h. at 50-5° and then 2 h. at 100°. Addition of 300 cc. 10% H2SO4 gave 68% of 4,6-dinitrophenylene-1,3-diacrylic acia, m. 216°, after purification through the Et ester (V), m. 116°, and saponification with H2SO4 in dilute AcOH. Reduction of 18 g. V with Rupe's Ni catalyst (VI) gave 14 g. di-Et 4,6-diaminophenylene-1,3-diacrylate, m. 195-6° (di-Ac derivative, m. 244-5°). Reduction of III with VI was unsuccessful. III (16 g.) in 600 cc. EtOH and 360 cc. concentrated NH4OH was dropped with strong stirring during 15 min. into 368 g. FeSO4 in 800 cc. H2O containing a few drops of 10% HCl warmed on the water bath. The Fe precipitate was extracted 15 h. in a Soxhlet with Me2CO (VII) and the residue after removal of VII, boiled with H2O and filtered. On strong chilling 84% of 4,6-diaminoisophthalaldehyde (VIII), m. 208°, separated; dioxime, m. 219-20°; disemicarbazone, chars above 360°; monophenylhydrazone, m. 275-6° (decomposition); diphenylhydrazone, m. 337° (decomposition); mono-Ac derivative, from VIII and Ac2O in the cold for 3 days, m. 270-2°; di-Ac derivative, prepared hot, m. 280-2°. VIII (0.5 g.) in 5 cc. MeCOPh containing 3-4 drops 10% MeOH-KOH at 100° for 10 min. gave, on precipitation with 50% EtOH, 70% of 2,7-diphenyl-lin-m-benzodipyridine, m. 216-17° (dipicrate, m. 270° (decomposition)). Similar condensation of VIII with AcCH2CO2Et gave di-Et 2,7-dimethylbenzodipyridine-3,6-dicarboxylate, m. 166-7°.
